About me

My adventure with Front-end began with designing a website in Figma. When I wanted to somehow materialize my project, out of curiosity I started experimenting with HTML and CSS. Before I knew it, I had written my first "Hello World" code in JS. The satisfaction of my working code gave me the motivation and curiosity to learn more and more advanced front-end technologies. Programming, designing and solving problems in code gives me incomparable satisfaction to this day.

Experience

Commercial website for an construction company

Project of a website advertising a design office. Used **React Router** library for easy switching between sections and **Framer Motion** for smooth animation and enhanced aesthetics.

React weather app

It's a web application that connects to an external API and retrieves the weather data of a selected city and displays it on the fly in panel below.

[Weather app](#)

Apu Apustaja OnePage

This is a fairly simple OnePage type site written with **HTML5** and **Scss**. It also contains interactive elements created with **JavaScript**. It tells the story of an Internet meme straight from Finland.

[Apu Apustaja](#)

More of my projects such as **CodeQuiz** and **Product landing page** can be found on my [Github](#). The projects were previously designed by me in **Figma**, and the graphics were mostly created in the **Affinity suite**.
